App Features

Bug fixes and feature implementations

Notes

●Changing the image and text on the first screens that pop up when you open the app. I'll provide the images

●In admin dashboard, being able to select and unselect methods for order checkout. Some brands prefer card only and some only do cash on delivery so that's why in admin dashboard where i'm manually managing brands and products, I want this option.

●Automatic small platform fees of 200 pkr on every order placed. I think this is already added but it's very inconsistent and sometimes doesn't add up accurately.

●5 percent transaction fees when customer use their card to checkout. Automatically add a 5 percent fee to checkout on card orders which customer can see as well before they place their order

●Deleting/removing option for notification tab because it's not set up yet. Deleting option for show more on featured, recommended products and recently added products.

●Fix the revenue statistics for order data in admin dashboard. Orders, customers, revenue, aov, etc

●Fix the wishlist issue. Wishlist is already created but I was unable to add products there.

•Fix the issue (I shared in the video) Sometimes when you click on brands icon from product page, it sometimes mistakenly opens the most recent brand added instead of the actual one

●Implementing 4 screens: Style page (when you click on a style from home page) Explore page (the second one) Brands page (when you click on show all brands from explore page) and checkout page.

•In admin dashboard where it shows reviews left on products, give an option right next to it to delete the reviews as well. Because there's no option right now to delete the reviews left on products. Sometimes it could be spam or misleading so that's why.

●In guest mode, if a person tries to add the product to cart or buy, it gives them an error just edit the text to make it say that "Please login to perform this action"For placing orders or adding products to wishlist while being on guest mode

●In admin dashboard, add a navigation arrow so I can view order or customer data on the previous pages as well. I've shared the image with you as well. Basically, as i'll add multiple products, there will be no way of going back to previous products or brands or styles etc so that's why I need navigation arrows that'll make it simple to move between pages.

●In admin dashboard, give me an option to promote products which then appear before other products in searches, homepage, categories etc. On some products, my margin will be better so I would want those products to appear first whether it's in search or categories.

●In admin dashboard, give me an option to duplicate products so that i can manually list loads of products myself. I need this because manually filling the detail and adding product could take quite load of time so with this feature i can just duplicate listings in seconds and then just edit the details which is much faster i believe.

●Products appear on homepage based on what users searches or adds to cart and likes. When you scroll the home page down, products start to show up and you can keep scrolling but they're sorted by recently added products. So products appear randomly each time someone opens the app
